The AGB2 is the new adjustable gas block for AR15 type rifles from D.F. MAISEY GUNSMITHING. It is essentially a slimmed-down and revised version of our earlier AGB1 model gas block, and is ideally suited to AR15 or AR10 type rifles which are fitted with one of the newer style slim-line free-float tube forends which may require the gas block to be housed inside of the forend piece. This adjustable gas block may be used in conjunction with a suppressor or other muzzle attachment to correctly regulate the gas impulse for smoother cycling, reduced recoil and gas spit from the action area (or past the charger handle), and to eliminate over-vigorous extraction which can lead to case damage or parts breaking prematurely.

CNC machined from solid steel, features up to 32 repeatable click-stop settings from fully-closed to fully-open, and simple one-tool operation. As with all NZ-made D.F. Maisey products, the AGB2 is a registered design, and international patents are pending.

For more info about this and some of our other products see: www.gunsmith.co.nz

AGB2 specifications:

- Suits barrel journal diameter: 0.750"
- Solid steel construction, black nitrided finish for surface hardness and good rust resistance
- 316 Stainless steel M4x0.7mm threaded main adjustment screw
- 1/8" diameter detent ball and spring system (easily removable if required)
- Stainless wave pin for gas tube retention included
- Clamps securely to barrel with 2x small grub screws on underside
- Flat sides of gas block body make fitting, alignment, and gas tube installation easier
- Unique/novel offset angled adjustment screw design permits more clicks per revolution, and a more robust and reliable main-screw design as the threaded section is not violated with machined slots. (The slots for the detent system are into the head of the main-screw, which is more robust.)
- Weight: 84 grams (3oz). Block length: 1.250" (31.75mm)
- Low profile design – this adjustable gas block body will fit inside all slim-line forends that have an internal diameter down to approximately Ø1.315". Contact us if you need any assistance.
- Comes with allen keys and a spacer/shim washers to aid in gas port alignment for rifles which are fitted with a free-float forend tube.

(Note: Long ball-end type allen key is supplied with kit for more flexibility and ease of alignment when adjusting the gas setting, especially if gas block is located inside a free-float forend tube.)
